

# Bedford 4X4 Truck

Powered by a 6 cylinder petrol engine, this truck was originally built for the British Military and has been converted to carry an Australia designed and built blower. The blower incorporates a 32 inch fan, which runs at 4000 rpm. The blower is used to draw dirt from underground tunnels during Opal Mining operations. It works in the same fashion as a vacuum cleaner, sucking dirt from the workings many metres below ground. The blower is powered by a 6 cylinder ford diesel engine.
